

Gen AI Academy

APAC Edition

Build in APAC. Build for the world.

Participant Details

- a. Participant Name: Shibi Dev
- b. Problem Statement: AI Powered Trainer Assistant & Co-ordinator

Brief about the idea

- Intelligent student coordinator for Trainings/ Meeting schedules depends on Trainer Calendar availability
- Instantly clarifies the Course syllabus queries
- Remember every student across sessions using structured notes
- Followup autonomously
- Trainers doesnt have to answer repetitive student queries
- Trainers doesnt have to manually create invites for student calls
- Creates actionable tasks fot the trainer

Your solution should be able to explain the following:

- How did you approach the common problem statement and translate it into a working solution using ADK, MCP/AlloyDB AI while ensuring Hackathon's core requirements are met?
 - What real-world problem does your solution address, and what practical impact does it create for users?
 - What is the core approach or workflow behind your solution?
-
- Trainers spend hours on repetitive queries, manual scheduling, and lost follow-ups
 - Built a multi-agent system using Google ADK where a primary agent coordinates student interactions and delegates memory/task work to a specialised MCP sub-agent
 - MCP protocol connects the agent to a FastMCP tool server exposing notes
 - Fully meets ADK requirements: primary + sub-agent architecture, MCP tool integration, structured DB storage, multi-step workflows, API deployment
 - Built entirely on Google-native stack (ADK + Gemini + Google Calendar) - no third-party AI dependencies, production-ready from day one

Opportunities

- How different is it from any of the other existing ideas?
- USP of the proposed solution
- The agent doesn't just respond - it coordinates. One student message can trigger a syllabus response, a calendar booking, a note saved, and a trainer task created - all in a single API call with zero human involvement
- Most AI chatbots for education are stateless, they answer and forget. This agent remembers every student across sessions and builds context over time
- Not just a Q&A bot - It takes real actions: books actual Google Meet calls, writes to a real calendar, logs to a real database
- Built on MCP protocol - tools are decoupled from the agent, meaning any new tool (Slack notification, LMS integration, payment) plugs in without touching agent logic
- Multi-agent by design - coordination and memory are separate concerns handled by separate agents, not one monolithic prompt
- Same architecture works for any cohort-based training program - swap the syllabus content and calendar, deploy for any trainer instantly
- Trainer gets a living task list auto-generated from student conversations - no manual notes, no missed follow-ups

List of features offered by the solution

- **Multi-Agent Coordination** : Primary agent routes intent, MCP sub-agent handles memory and tasks independently
- **Instant Syllabus Delivery** : Agent answers course content queries in real time without trainer involvement
- **Automated Meeting Scheduling** : Books Google Meet calls via Calendar API and returns the link directly to the student
- **Persistent Student Memory** : Notes saved per student and retrieved in future sessions so context is never lost
- **Auto Task Generation** : Agent creates trainer to-do items from student conversations automatically
- **Inquiry Logging** : Every student interaction logged to database with email, action, and timestamp
- **Google-Native Stack** : ADK + Gemini 2.5 Flash + Google Calendar API + FastMCP, no third-party AI dependencies
- **Docker Ready** : Containerised for immediate deployment to Cloud Run or any container platform

Process flow diagram or Use-case diagram

Wireframes/Mock diagrams of the proposed solution

Architecture diagram of the proposed solution:

Technologies/Google Services used in the solution

(Why did you choose your specific AI stack and system design, and how does it support scalability and real-world deployment?)

- Google Agent Development Kit (ADK) (Multi-agent orchestration)
- Gemini (Generative AI / LLM)
- Google Cloud Run (Application hosting & deployment)
- Google Calendar API (Meeting scheduling)
- Google Cloud (Underlying cloud infrastructure)

Snapshots of the prototype
